

CONTENTS

Chapter 1: Introduction & overview.	1
1.1 Introduction.	1
1.2 Terminology & general approach.	4
1.3 Who will this interest?	5
1.4 Why look at tests of two simple hypotheses.	5
1.5 Overview.	6
Chapter 2: Formal concepts & principles and informal interpretations.	11
2.1 Optimal inference.	11
2.2 Sufficiency & Ancillarity.	16
2.3 Evidential interpretations of Neyman-Pearson inference.	23
Chapter 3: Some problems with evidential frequentist inference.	26
3.1 Tests of two simple hypotheses.	26
3.2 Tests against a composite alternative hypothesis.	41
Chapter 4: Seminal moments in the history of the conditioning controversy.	47
4.1 Introduction.	47
4.2 Welch (1939).	47
4.3 Cox (1958).	62
4.4 Birnbaum (1962).	68
Chapter 5: What is a good inference?	74
5.1 Buehler's gambling criterion.	74
5.2 Principles and controversies.	91
5.3 Conditional inference today.	112
Chapter 6: Welch's Uniform example re-visited.	120
6.1 Introduction.	120
6.2 Randomising: Adding arbitrary requirements to a test.	121
6.3 Both analyses of the Uniform model are wrong.	123
6.4 Using the likelihood ratio statistic in the Uniform example.	130
6.5 Using a 'better' ancillary statistic for the Uniform case.	136
6.6 Gambling on the Uniform example with a better ancillary statistic.	147
Chapter 7: An alternative measure of evidence.	157
7.1 Using the likelihood ratio as a measure of evidence.	159
7.2 Royall's canonical experiment.	162
7.3 Basing a dichotomous inference on the likelihood ratio.	163
7.4 Where to for frequentist inference?	175

Chapter 8: Exhaustive conditional inference for log-symmetric models.	176
8.1 Ancillary statistics for a binary parameter space.	176
8.2 Conditional inference on the mean of a Normal population.	178
8.3 Defining an exhaustive ancillary statistic.	181
8.4 Conditional probability in the limit.	183
8.5 Conditioning in the log-symmetric case.	185
8.6 Exhaustive conditional inference on the mean of a Normal population. ...	190
8.7 Creating hypothesis tests with good conditional properties.	211
8.8 Interval estimates.	222
8.9 The Cauchy location model.	225
8.10 Other log-symmetric scenarios.	238
8.11 Why the cp-value is larger than the p-value, in all log-symmetric cases. ...	245
8.12 Comments and summary.	251
 Chapter 9: Exhaustive ancillary statistics for more general cases.	253
9.1 When a testing scenario is not log-symmetric.	253
9.2 The ‘difference of distribution functions statistic’.	254
9.3 The DDF statistics for some log-symmetric testing scenarios.	261
9.4 Conditioning on the DDF statistic: definitions and results.	261
9.5 The pairing function.	265
9.6 The most relevant error probabilities.	267
9.7 A general requirement for sensible inferences.	268
9.8 Wald’s sequential probability-ratio stopping rule and exhaustive conditional inference.	274
9.9 Inference Classes.	277
 Chapter 10. Conditioning on the DDF statistic in cases that are not log-symmetric.	287
10.1 Tests on the variance of a Normal population.	287
10.2 Tests on the mean of an Exponential population.	293
10.3 Scenarios involving the Gamma distribution.	308
10.4 Tests on the Weibull model.	319
10.5 A better model for studying the Welch phenomena.	323
10.6 Tests on general Normal hypotheses.	344
10.7 Conjectures on the asymptotic properties of exhaustive conditional inference.	348
 Chapter 11: Summary and conclusions.	353
11.1 In search of evidence.	353
11.2 Problems with using conventional unconditional frequentist inference to find evidence.	353
11.3 Improving frequentist inference by conditioning.	354
11.4 Properties of exhaustive conditional inference.	356
11.5 Conjectures and unanswered questions.	362
11.6 Two fundamental criticisms of ECI.	364
11.7 Likelihood-like frequentism.	366
